Classes and Objects in Java

## Basics of Classes in Java

Contents

- Introduce to classes and objects in Java.

- Understand how some of the OO concepts learnt so far are supported in Java.

- Understand important features in Java classes.

Introduction

- Java is a true OO language and therefore the underlying structure of all Java programs is classes.
- Anything we wish to represent in Java must be encapsulated in a class that defines the "state" and "behaviour" of the basic program components known as objects.
- Classes create objects and objects use methods to communicate between them. They provide a convenient method for packaging a group of logically related data items and functions that work on them.
- A class essentially serves as a template for an object and behaves like a basic data type "int". It is therefore important to understand how the fields and methods are defined in a class and how they are used to build a Java program that incorporates the basic OO concepts such as encapsulation, inheritance, and polymorphism.

3

Classes

- A *class* is a collection of *fields* (data) and *methods* (procedure or function) that operate on that data.

Circle
centre radius
circumference() area()
Classes

- A *class* is a collection of *fields* (data) and *methods* (procedure or function) that operate on that data.
- The basic syntax for a class definition:

```
class ClassName [extends SuperClassName]
{
        [fields declaration]
        [methods declaration]
}
```

- Bare bone class – no fields, no methods

```
public class Circle {
      // my circle class
}
```

Adding Fields: Class Circle with fields

- **Add *fields***

```
public class Circle {
        public double x, y;  // centre coordinate
        public double r;     //  radius of the circle

}
```

- **The fields (data) are also called the *instance* varaibles.**
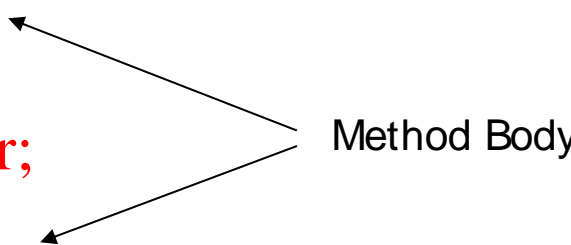

Adding Methods

- A class with only data fields has no life. Objects created by such a class cannot respond to any messages.

- Methods are declared inside the body of the class but immediately after the declaration of data fields.

- The general form of a method declaration is:

```
type MethodName (parameter-list)
{
        Method-body;
}
```

Adding Methods to Class Circle

```
public class Circle {

    public double x, y; // centre of the circle
    public double r;    // radius of circle

    //Methods to return circumference and area
    public double circumference() {
                return 2*3.14*r;
    }
    public double area() {
                return 3.14 * r * r;
    }
}
```
Method Body

Data Abstraction

- Declare the Circle class, have created a new data type – Data Abstraction

- Can define variables (objects) of that type:

   Circle aCircle;
    Circle bCircle;

Class of Circle cont.

- aCircle, bCircle simply refers to a Circle object, not an object itself.

aCircle

null

Points to nothing (Null Reference)

bCircle

null

Points to nothing (Null Reference)

Creating objects of a class

- Objects are created dynamically using the *new* keyword.
- aCircle and bCircle refer to Circle objects

aCircle = new Circle() ;

bCircle = new Circle() ;

Creating objects of a class

```
aCircle = new Circle();
bCircle = new Circle() ;

bCircle = aCircle;
```
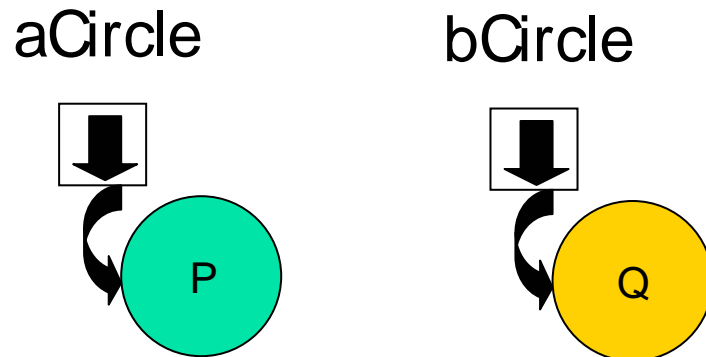

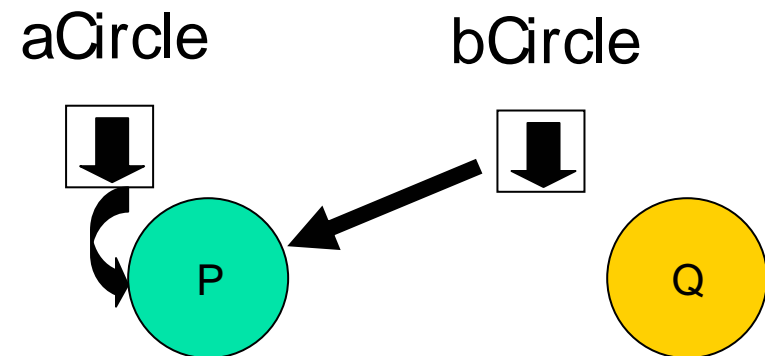

Creating objects of a class

aCircle = new Circle();
bCircle = new Circle() ;

bCircle = aCircle;

Before Assignment

aCircle   bCircle

P   Q

Before Assignment

aCircle   bCircle

P   Q

13

Automatic garbage collection

- The object   Q   does not have a reference and cannot be used in future.

- The object becomes a candidate for automatic garbage collection.

- Java automatically collects garbage periodically and releases the memory used to be used in the future.

Accessing Object/Circle Data

- Similar to C syntax for accessing data defined in a structure.

ObjectName.VariableName
ObjectName.MethodName(parameter-list)

Circle aCircle = new Circle();

aCircle.x = 2.0 // initialize center and radius
aCircle.y = 2.0
aCircle.r = 1.0

Executing Methods in Object/Circle

■ **Using Object Methods:**

sent 'message' to aCircle

```
Circle aCircle = new Circle();

double area;
aCircle.r = 1.0;
area = aCircle.area();
```

Using Circle Class

```
// Circle.java:  Contains both Circle class and its user class
//Add Circle class code here
class MyMain
{
      public static void main(String args[])
      {
            Circle aCircle;  // creating reference
            aCircle = new Circle(); // creating object
            aCircle.x = 10;  // assigning value to data field
            aCircle.y = 20;
            aCircle.r = 5;
            double area = aCircle.area(); // invoking method
            double circumf = aCircle.circumference();
            System.out.println("Radius="+aCircle.r+" Area="+area);
            System.out.println("Radius="+aCircle.r+" Circumference ="+circumf);
      }
}
```

```
[raj@mundroo]%: java MyMain
Radius=5.0 Area=78.5
Radius=5.0 Circumference =31.400000000000002
```

Summary

- Classes, objects, and methods are the basic components used in Java programming.

- We have discussed:

  - How to define a class

  - How to create objects

  - How to add data fields and methods to classes

  - How to access data fields and methods to classes
